

Local discretisation in 3d electromagnetic fields calculation using FDM method.

PhD, Adam, Turkot, Poznań University of Technology, Poland

Abstract

This paper presents summary of author work on local discretisation algorithm. Presented algorithm was implemented in FDM method for 3d electromagnetic fields computation taking into consideration different excitations and fields representations. In paper is presented main idea of local increase of net grids density. The advantage of this method is described in comparison for standard FDM.
